

New Modality Issues: DICOM Enhanced Images CT, MR, PET, XA/XRF

Dr. David A. Clunie, MB.,BS., FRACR

Chief Technology Officer

RadPharm, Inc.

Disclosures

- David Clunie, MBBS, FRACR
 - *CTO, RadPharm, Inc. (formerly Princeton Radiology Pharmaceutical Research)*
 - *PixelMed Publishing - contractor for the NEMA Enhanced CT and MR test tools and images*

Acknowledgments

- *Kees Verduin, Philips Medical Systems*
- *Robert Haworth, GE Healthcare*
- *Charles Parisot, GE Healthcare*
- *Bernhard Hassold, Siemens Medical Solutions*
- *Bradley J Erickson, Mayo Clinic*

Acquisition - Standards

- Proprietary connections
 - Not scalable
 - Too expensive
 - Single vendor for PACS and all modalities implausible
- 1983 ACR-NEMA Committee
 - American College of Radiology
 - National Electrical Manufacturer's Association
- 1985 ACR-NEMA Version 1.0
- 1988 ACR-NEMA Version 2.0
- 50 pin plug point-to-point interface (no network, no files)
- Tag-value pairs of data elements
 - Describing acquisition and identifying patient

Acquisition - Standards

- Post-ACR-NEMA PACS and Modalities
 - Several vendors used ACR-NEMA ideas in proprietary networks
 - Siemens-Philips SPI
 - ACR-NEMA as a file format
- 1982 Interfile for Nuclear Medicine
 - AAPM
 - European COST-B2 project
- By 1990's still no widely adopted standard for
 - Specific modality requirements for all modalities
 - Network based transport and services

Acquisition - DICOM

- 1993 - Digital Imaging and Communications in Medicine
- Network-based
 - TCP/IP over Ethernet
- Services for
 - Storage (transfer)
 - Query and retrieval
 - Printing
- Derived from ACR-NEMA
- Added concepts of modality-specific information objects
- Conformance requirements and statement
- Interchange file format and media quickly added (1995)

1993 DICOM Image Objects

- Computed Radiography
- Computed Tomography
- Magnetic Resonance Imaging
- Nuclear Medicine
- Ultrasound
- Secondary Capture

2006 DICOM Image Objects

- Computed Radiography
- Computed Tomography
- Magnetic Resonance Imaging
- Nuclear Medicine
- Ultrasound
- Secondary Capture
- X-Ray Angiography
- X-Ray Fluoroscopy
- Positron Emission Tomography
- Radiotherapy (RT) Image
- Hardcopy Image
- Digital X-Ray
- Digital Mammography
- Intra-oral Radiography
- Visible Light Endoscopy & Video
- VL Photography & Video
- Visible Light Microscopy
- Multi-frame Secondary Capture
- Enhanced MR
- MR Spectroscopy
- Raw Data
- Enhanced CT
- Enhanced XA/XRF
- Ophthalmic Photography

2006 DICOM Non-Images

- Radiotherapy (RT) Structure Set, Plan, Dose, Treatment Record
- Waveforms (ECG, Hemodynamic, Audio)
- Grayscale, Color and Blending Presentation States
- Structured Reports
- Key Object Selection
- Mammography and Chest Computer Assisted Detection (CAD)
- Procedure Log
- Spatial Registration (Rigid and Deformable) and Fiducials
- Stereometric Relationship
- Segmentation

DICOM Challenges

- Expansion of scope
 - From images to workflow, reporting, therapy ...
- Evolution of modality technology
 - Speed and resolution of CT
 - Pulse sequences, gradients and field strength in MR
- Evolution of clinical applications
 - Enabled by technology
 - Enabled by contrast agents and radionuclides

DICOM Challenges

- More information
- More slices
- More complex applications on workstation
- Greater expectations of inter-functionality between different vendors modalities and workstations

What is *Inter-operability* ?

- Analogy of web server/browser:
 - Inter-connectivity - both talk TCP/IP
 - Inter-operability - both talk HTTP and HTML
 - Inter-functionality - not guaranteed:
 - “versions” of HTML poorly controlled
 - layout not constrained by HTML
 - availability of proprietary extensions (plug-ins, applets)
 - e.g., “this page only for IE version 5.0”
- Good, but not good enough for healthcare

DICOM and *Inter-operability*

- For example, conformance to DICOM
 - will guarantee network connection
 - will guarantee storage of MR image:
 - from Modality to Workstation
 - will NOT guarantee (but will facilitate):
 - workstation will display image “correctly”
 - workstation can perform the analysis the user wants
 - facilitated by mandatory attributes for:
 - identification, annotation, positioning, etc.
 - *newer DICOM objects increase what is mandatory*

Greater Inter-functionality

- Cardiac motion - vendor independent applications that handle spatial and temporal (cardiac cycle) CT and MR images
- Diffusion MR - vendor independent applications that handle diffusion B value and direction
- Multi-stack spine - vendor independent applications that recognize stacks of parallel slices through inter-vertebral disk spaces
- Contrast and perfusion - vendor independent applications that recognize timing and phase of enhancement in CT and MR images for display and or quantitative analysis
- Spectroscopy - vendor independent applications that process and display single-voxel, multi-voxel or multi-slice MR spectra and reference and metabolite map images

Enhanced DICOM Images

- Enhanced MR Image - Sup 49 (standard)
- Enhanced CT Image - Sup 58 (standard)
- Enhanced XA/XRF - Sup 83 (standard)
- Enhanced PET - Sup 117 (work in progress)
- 3D X-ray - Sup 116 (work in progress)
- Enhanced US - Sup 43 (work in progress)

Multi-frame Organization of New CT & MR Images

- Original objects
 - Series organization + single frame + a few attributes + terms
- Enhanced objects
 - Multiple frames in a single object
 - Many more standard mandatory attributes
 - Many more standard terms
- Enables
 - Greater interfunctionality of applications
 - More effective hanging protocols
 - Reduced dependence on private attributes

Technique Attributes & Terms

	CT		MR	
SOP Class	Original	Enhanced	Original	Enhanced
Attributes (Mandatory)	18 (0)	41 (39)	44 (2)	103 (94)
Terms (Enumerated)	4 (2)	86 (18)	38 (9)	228 (47)

CT Image Type Value 3

- Original SOP Classes
 - AXIAL or LOCALIZER
- Enhanced SOP Classes
 - Common to CT and MR
 - ANGIO, FLUOROSCOPY, LOCALIZER, MOTION, PERFUSION, PRE_CONTRAST, POST_CONTRAST, REST, STRESS, VOLUME
 - CT-specific
 - ATTENUATION, CARDIAC, CARDIAC_GATED, REFERENCE

MR Acquisition Contrast

- Original SOP Classes
 - Guess from echo and repetition time, etc.
- Enhanced SOP Classes
 - New mandatory frame level attribute
 - Acquisition Contrast
 - DIFFUSION, FLOW_ENCODED, FLUID_ATTENUATED, PERFUSION, PROTON_DENSITY, STIR, TAGGING, T1, T2, T2_STAR, TOF, UNKNOWN

Geometry unchanged

- Same as original SOP Classes
- Image Position and Orientation (Patient)
- Still need to compute AXIAL, SAGITTAL or CORONAL from orientation vector
- Still need to compute edge labels (A/P etc) from orientation vector
- May still need to compare orientation vectors to determine if slices are parallel - stacks will be discussed later

Enhanced Contrast/Bolus

- Original SOP Classes
 - Plain text description
 - Difficult to determine presence/absence
 - E.g., description value of “None”
 - Single agent (did not distinguish oral/iv)
 - Codes optional and never used
- Enhanced SOP Classes
 - Mandatory codes only
 - Multiple items with separate coded routes & timing
 - Presence or absence per-frame can be described

Coded anatomic regions

- Original SOP Classes
 - Incomplete list of optional defined terms
 - Optional laterality
- Enhanced SOP Classes
 - Mandatory coded anatomic region
 - Comprehensive & appropriate list of codes
 - Mandatory laterality
 - Per-frame or for entire object
- E.g.
 - (R-FAB56,SRT,“Chest, Abdomen and Pelvis”)
 - Not free text “C/A/P” or “CAP.” or “Chest, abdo, pelvis” etc.

Hangin protocol rule impact

Hanging protocol rule impact

Same rules, independent of whether:

- one single multi-frame image
- one multi-frame image per acquisition
- one slice per single frame image
- one series or multiple

Hanging protocol support

- A productivity advantage of the CT and MR objects
- Should not have to tailor hanging protocol rules to specific vendors or devices or versions
- Reliable and standard information
 - Mandatory and standard places (attributes)
 - Mandatory and standard values
- As technology evolves, yet more standard values will be added to the standard
- Eliminate dependence on site configured Series Number or Series Description, whether from acquisition protocol or entered by operator

DICOM Hanging Protocols

- Foregoing describes how to use attributes in Enhanced CT and MR objects to improve any hanging protocol engine, including proprietary software
- DICOM also has recently defined Hanging Protocol SOP Classes
- To store hanging protocol rules centrally and exchange them between different systems
- Not a pre-requisite for making use of the enhanced image objects to improve hanging

Beyond simple image display

- Visualization
- Temporal change
 - Short term
 - Long term
- Quantitation and Analysis

Visualization

- MPR
- 3D surface and volume rendering
- MIP for angiography
- Fusion

Temporal change

- Short term
 - Perfusion
 - Cardiac cycle
- Long term
 - Change over time between studies

Quantitation and analysis

- Processing of multiple frames
- Measurement of morphology
 - Linear distance
 - Volumetrics
- Measurement of physiology and function
 - Perfusion and diffusion
 - fMRI
- Registration
 - between acquisitions, studies & modalities

Jackson, 2003, BJR

Supporting advanced applications

- Original SOP Classes
 - Minimal standard acquisition information
 - Imprecisely defined timing information
 - No organizational structures except Series
 - Quantitation mixed with grayscale pipeline
- Enhanced SOP Classes
 - Detailed descriptions of advanced acquisition protocols
 - Accurate and well-defined timing information
 - Pre-defined organizational structures
 - Quantitative values and color support

Enhanced MR attribute types

- Separate gradient and RF echo train lengths
- Out-of-plane phase encoding steps
- Flow compensation
- Spectrally selective excitation & suppression
- Blood signal nulling
- Tagging
- Diffusion values and direction
- Spatial saturation slabs
- Velocity encoding
- Chemical shift imaging (metabolite maps)

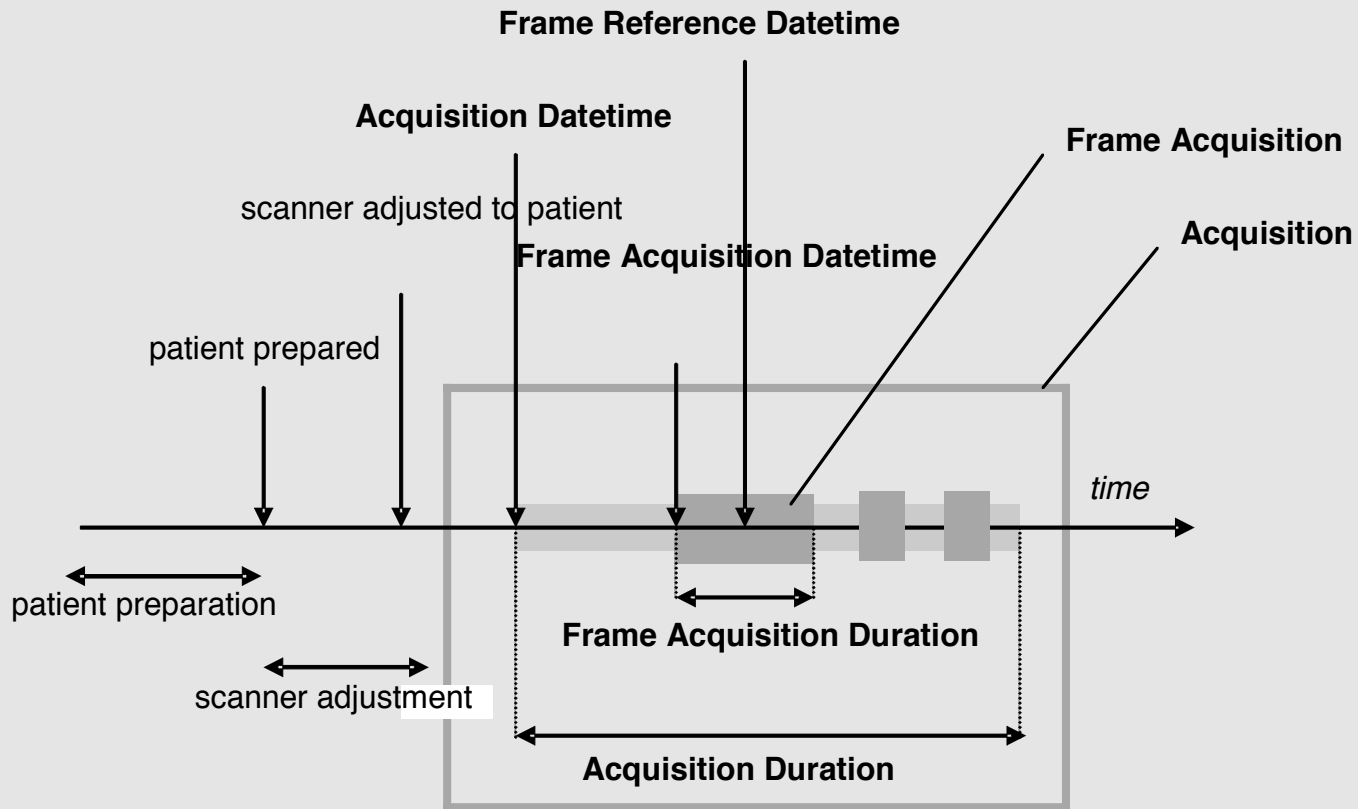

Enhanced CT attribute types

- Acquisition type
- Constant volume and fluoroscopy
- Single and total collimation width (for multiple detectors)
- Table speed, feed and spiral pitch factor
- Reconstruction geometry and convolution kernel
- Exposure information, dose savings and $CTDI_{Vol}$

Timing information

- Original SOP Classes
 - Inconsistent use of Content (Image) and Acquisition Time
 - Contrast timing information never used
- Enhanced SOP Classes
 - Unambiguous definition of acquisition timing
 - Explicit relationships with contrast & cardiac timing

Timing information

Timing information

Contrast timing

- Numeric - Administration Profile
 - Allows for multiple contrast agents and phases
 - Volume, start/stop times, rates and duration
- Categorical
 - Can be specified on a per-frame basis
 - Administered - YES/NO
 - Detected - YES/NO
 - Phase - PRE_CONTRAST, POST_CONTRAST, IMMEDIATE, DYNAMIC, STEADY_STATE, DELAYED, ARTERIAL, CAPILLARY, VENOUS, PORTAL_VENOUS

Contrast timing - phase for hanging protocols

Organizational Features

- Multi-frame pixel data
- Shared and per-frame functional groups
 - Each functional group contains attributes that likely vary as a group, e.g. Pixel Measures, Plane Orientation, Velocity Encoding, etc.
 - Compact & makes explicit what doesn't change
- Dimensions
 - *a priori* hints as to how the frames are organized
 - Specify intended order of traversal, such as space, then time (e.g., for cardiac cine loops)
- Stacks
 - Groups of spatially-related slices, repeatable
- Temporal positions

Organization of Data

- Goal is to reduce the work that the receiving application has to do to “figure out”
 - How the data is organized
 - Why it is organized that way
- Without preventing use of the data in unanticipated ways
 - E.g. 3D on a dataset not intended as a volume
- Two levels
 - The detailed shared & per-frame attributes
 - The overall dimensions, stacks and temporal positions

0 ms

1

Stack ID = 1

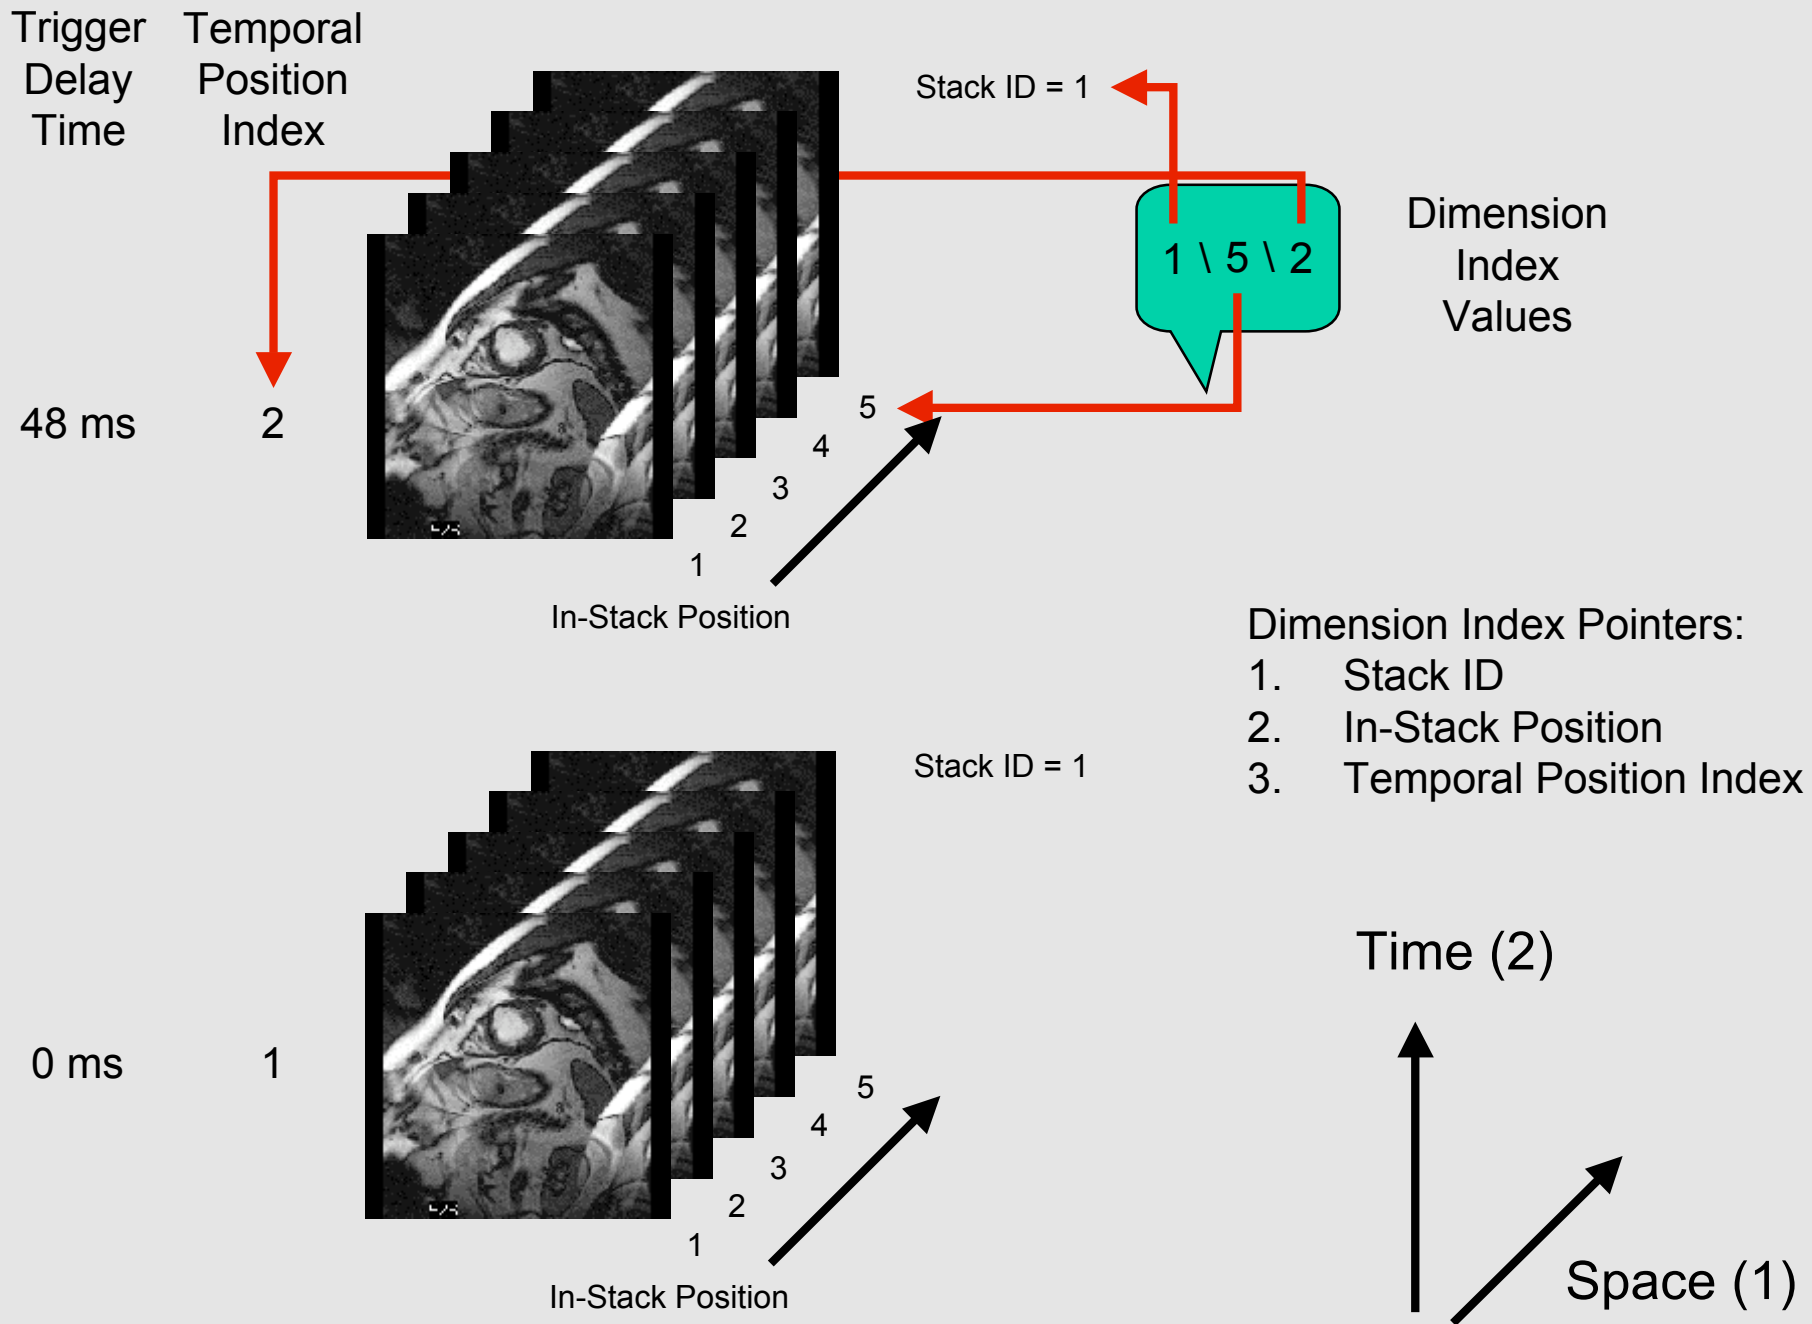

In-Stack Position

Time

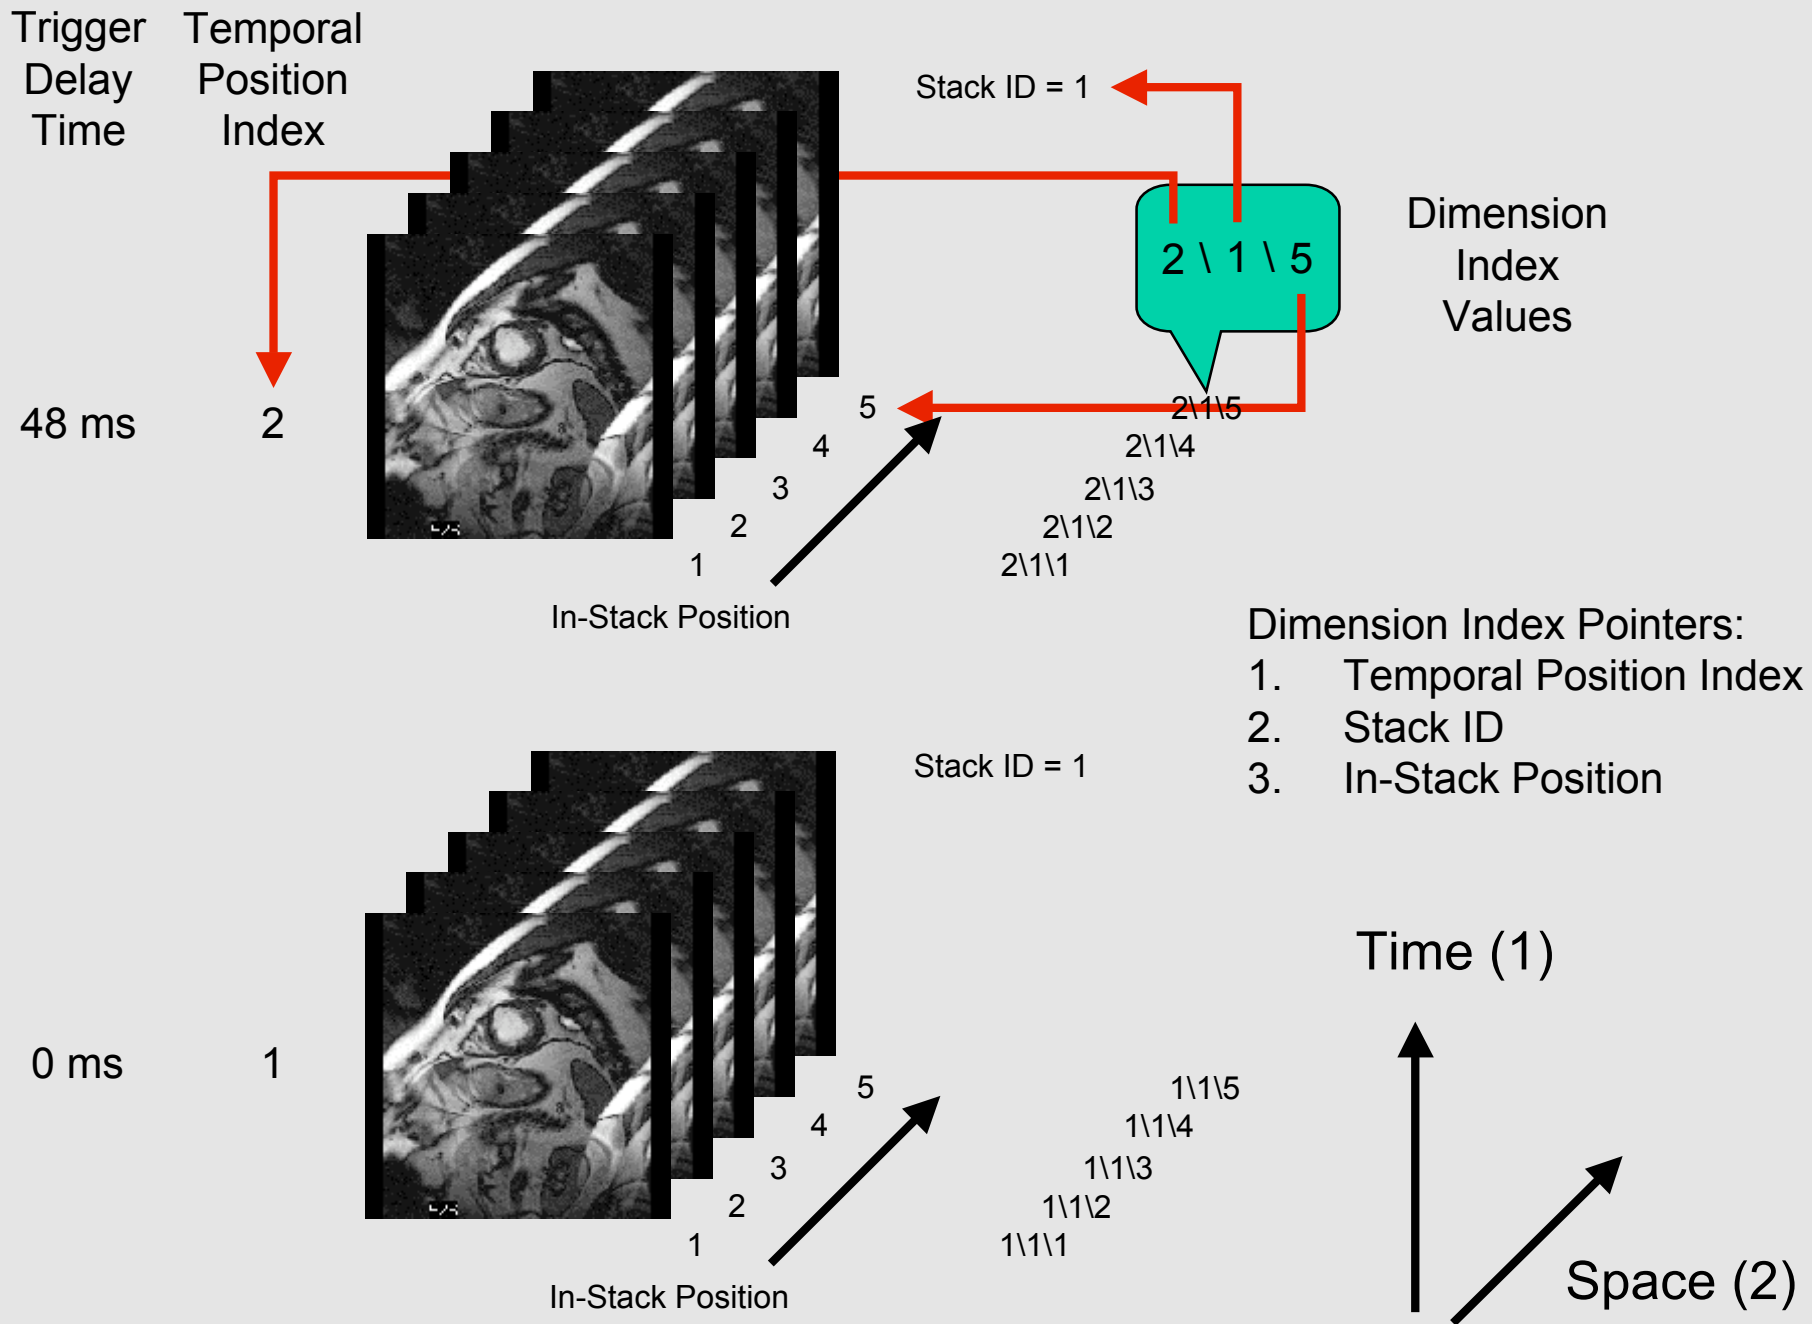

Space

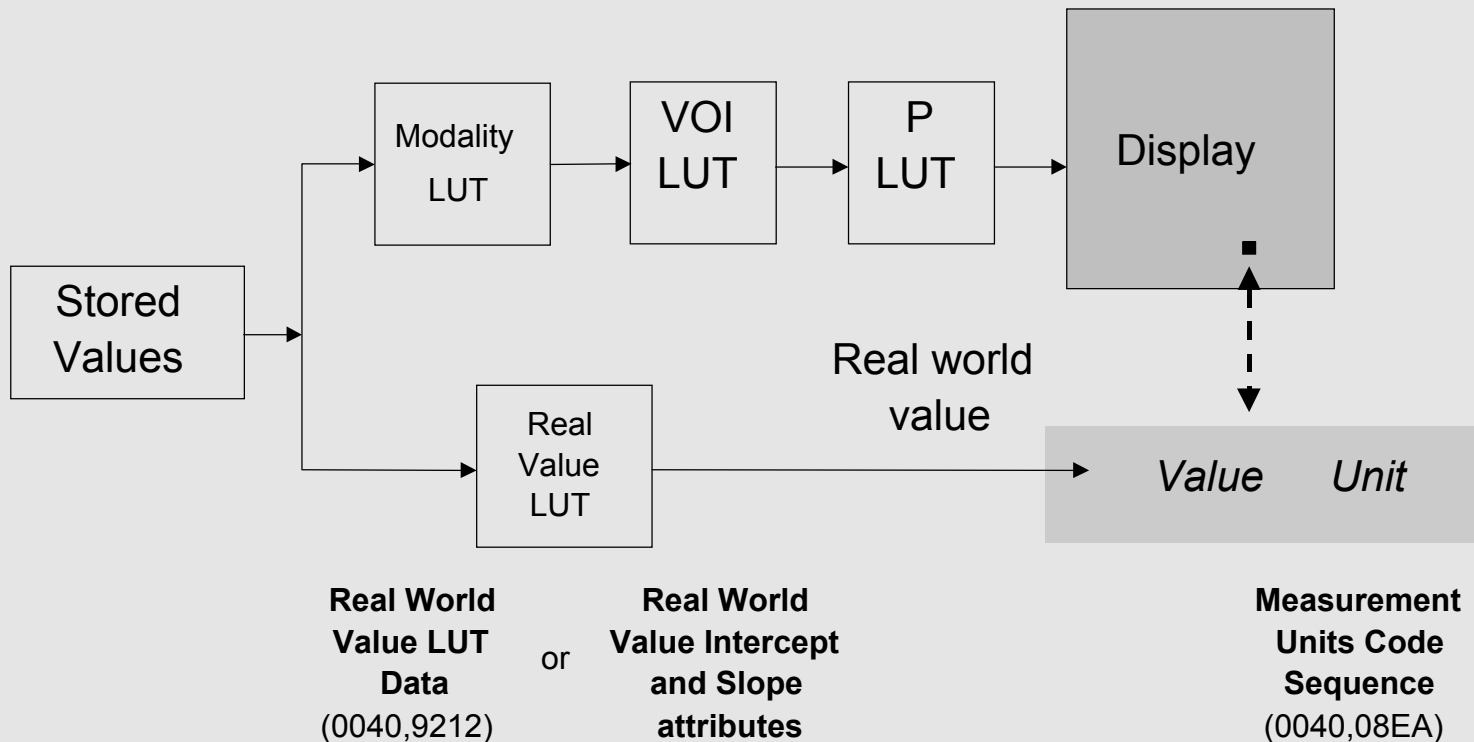

Dimension features

- Description of dimensions separate from their indices
 - Dimensions are described once
 - Indices within dimensions are encoded per-frame
- Receiving application only needs to follow the index values
 - Does NOT need to select or sort by attribute value
 - Dimensions can be entire functional groups
 - Dimensions can be private attributes or functional groups

Dimension applications

- Selection of sort order for simple viewing
- Partitioning of frames for hanging
- Selection of frames that constitute a
 - volume in space
 - temporal sequence
 - contrast administration phase
 - physiological parameter, e.g. diffusion b value

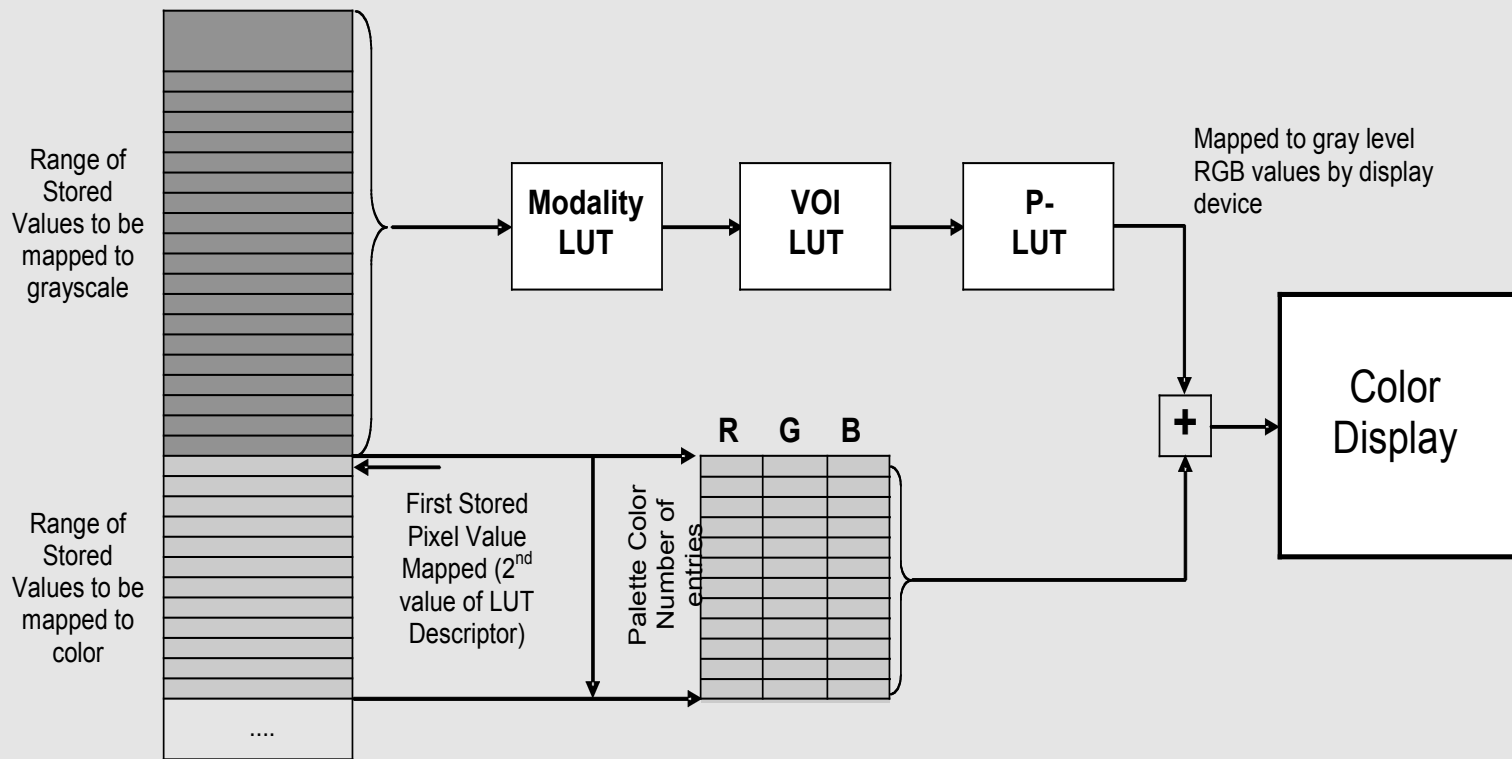

Quantitation of pixel values - Real World Values

Real World Values

- Separate from grayscale pipeline
- May be non-linear
- May be multiple mappings into different units

Color information applications

Perfusion

Diffusion

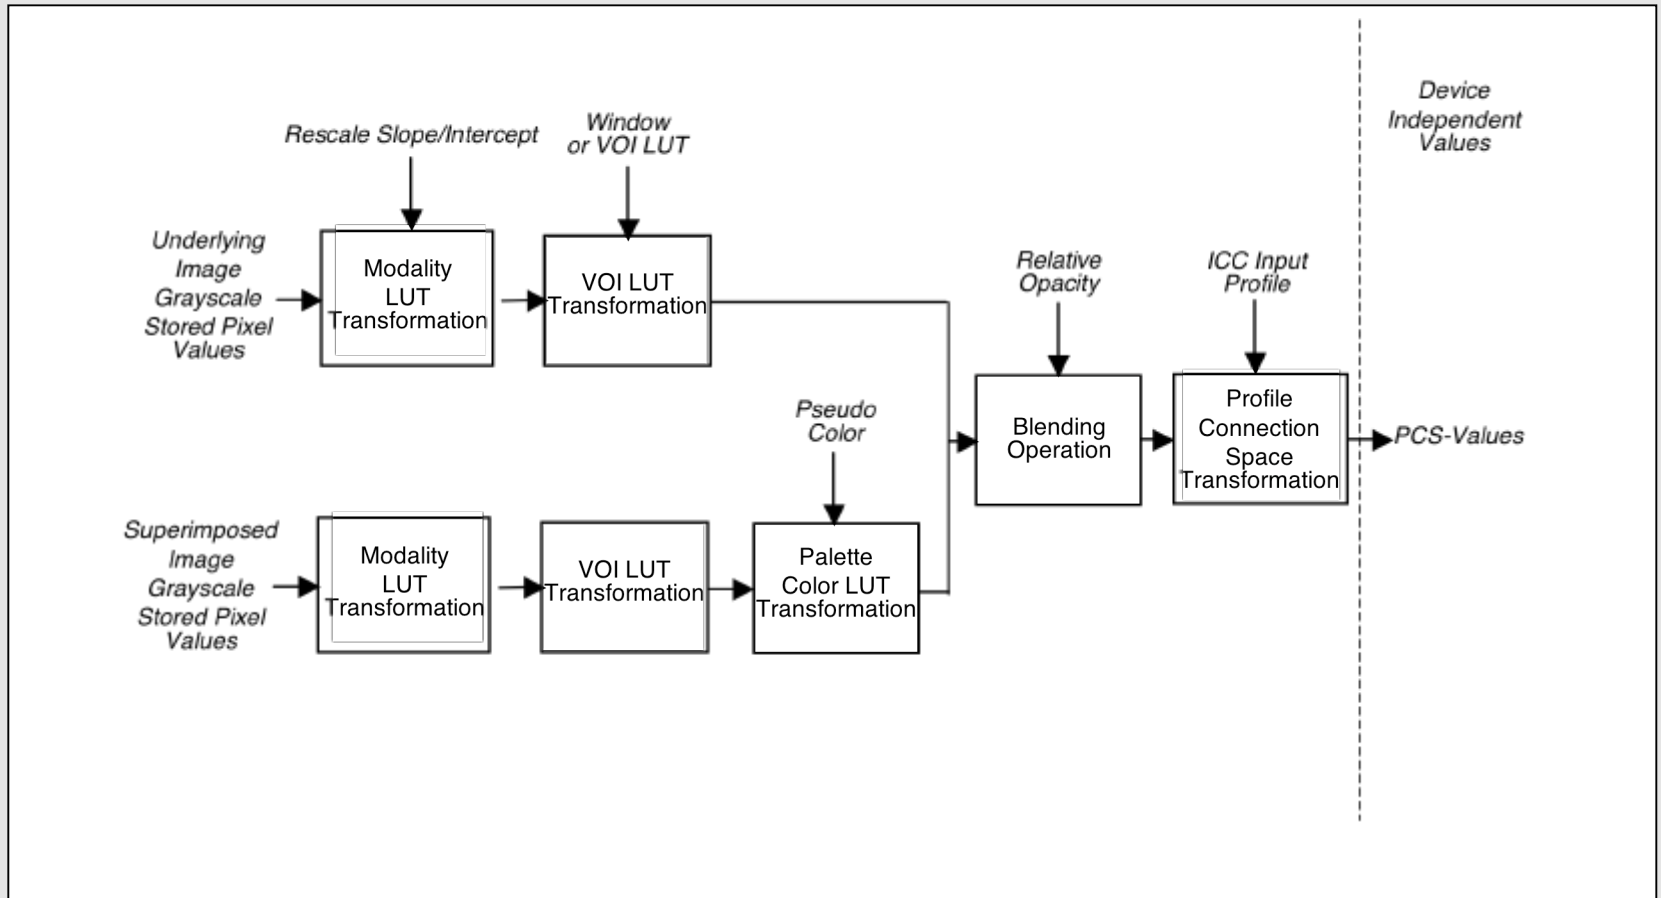

Functional

Color is *not* used for Multi-modality fusion

- Intention is to limit color use *in image* to where
 - Information is known added at acquisition
 - Involves pixel value replacement
 - Needs windowing of underlying grayscale
- Does not support transparency
- Separate new DICOM objects for
 - Spatial registration and fiducials
 - Blending presentation state for fusion
 - New enhanced multi-frame PET in development

Spectroscopy

Metabolite Maps

MR Spectroscopy

Storage of
Spectroscopy Data

Metabolite Maps

MR Spectroscopy

- Two types of data
 - Spatially localized spectra (signal intensity versus frequency or time)
 - Images of one particular part of the spectrum (chemical shift image or metabolite map)
- Metabolite maps are stored as images
- Spectra cannot be not stored as pixel data
- In the past - stored as screen saves of curves
- Now - MR Spectroscopy SOP Class
 - Arrays of floating point and/or complex values
 - 1D or 2D data for single or multiple voxels and frames
 - Allows for interaction, analysis and quantitation

(7:172,4)

Raw Data

- MR and CT have “raw data” prior to reconstruction into spatial domain images (k-space data, raw views)
- Need for different reconstructions
 - Slice thickness and reconstruction interval
 - Different convolution kernel (bone, lung)
 - Different field of view
 - For CAD versus human viewing
- Raw data is bulky and proprietary
- Local long term archival on modality possible but unusual and inconvenient, therefore time window for retrospective reconstruction is limited

Raw Data SOP Class

- Goal is storage of encapsulated raw data in the PACS or other central archive
- Without standardizing raw data format
- Defines usual patient, study, series, instance attributes
- No standard payload - raw data assumed to be in private attributes
- Allows for storage and retrieval without understanding
- No expectation that different vendors will be able to use the data
- SOP Instance UID of raw data can be referenced from images and spectra

Performance Opportunities

- New multi-frame object does not change
 - TCP connection establishment
 - Association establishment
- Common header information is not repeated
 - But reduction is negligible compared to pixel data size
- Reduced latency (delay) between storage requests
- Fewer database insertions
 - One entry in image table versus one per slice
- Creates opportunity for inter-slice (3D) compression
- Extremely implementation-dependent

------	---

Single database insertion - just don't need per-slice detail in database

Multi-frame compression

- Original CT and MR SOP Classes are single frame
 - Compression only possible within a single frame
 - Lossless - typically 3:1 or 4:1 for CT and MR
- Multi-frame objects
 - Opportunity to take advantage of redundancy between frames
 - Spatial redundancy - JPEG 2000 Part 2
 - Lossless gain modest, lossy gain more substantial
 - Motion prediction - MPEG-2 and others
 - New schemes - H.264/MPEG-4 Part 10
 - Entire dataset (e.g., 3D volume) or adjacent slabs

Single frame lossless compression

Single frame lossless compression

Lossless JPEG 2000 Compression (Alexis Tzannes, Aware, 2003)

160:1

Multi-frame compression performance reality check

- Lossless compression in 3D
 - Slight gain - 15 to 20% smaller than 2D
- Lossy compression in 3D
 - Modest gain - possibly 50% smaller than 2D
 - But - only relatively modest loss before noticeable
 - Perhaps (?) 16:1
- Siddiqui et al, SCAR 2004
 - Thinner slices compress poorly due to noise
 - 3D JPEG 2000 compression may be used to compensate
- Need more experiments
 - Effect on observer performance unknown

But when ?

Modality

PACS

NEMA Initiatives

- MR test tools, images and spectra available
- CT test tools and images available
- Implementation testing & demonstration
 - June 2005 - SCAR demonstration
 - November 2005 - RSNA InfoRAD demonstration

NEMA & SCAR Test & Demonstration

Purpose of the Test & Demonstration

- Participants
 - Test that it works
 - Identify problems and solutions
- Other vendors
 - Show what work needs to be done
- Users
 - Show that it works
 - Begin to show some of the benefits
 - Performance
 - Interoperability of new attributes, dimensions, applications, spectroscopy ... testing of clinical scenarios

Enhanced objects in products

- Google survey of conformance statements (Cor Loef, Philips, Nov 2006)
 - MR - 25 devices (2 modalities - Philips, Toshiba (?))
 - CT - 9 devices (1 modality - Toshiba)
- MR spectroscopy
 - 2 modalities (Philips, Siemens)
- Remains for workstation applications to take advantage of new features

Enhanced objects not just for MR & CT ...

- PET
 - Currently single slice
 - Driven by renewed interest in PET-CT fusion
 - Work in progress
- X-ray angiography and RF
 - Support for digital detectors
 - New acquisition types
- 3D X-ray
 - Rotational angio, tomosynthesis and cone beam CT
 - Work in progress
- 3D Ultrasound
 - Work in progress

Conclusion

- New DICOM image and other objects to address new applications & technology
- Greater inter-functionality for more complex clinical scenarios and applications
- Performance opportunities for large data volumes
